# Product & System Introduction

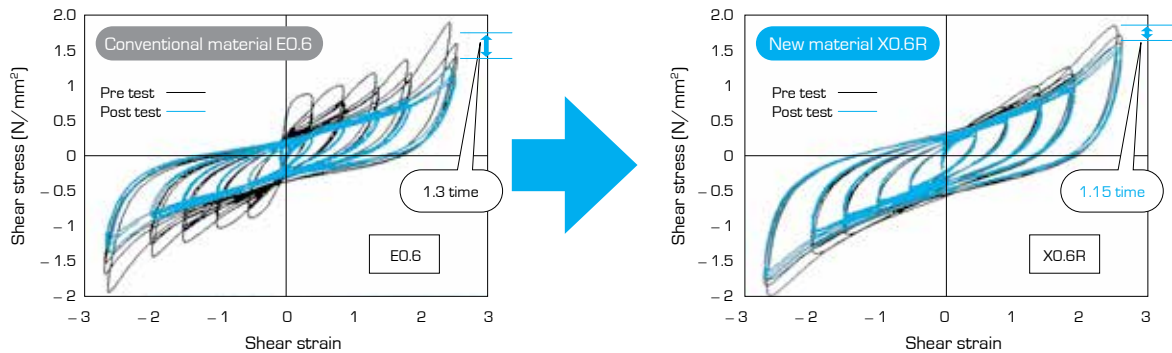

## High Damping Rubber Bearing X Series

### Features of High Damping Rubber Bearing X Series

High damping rubber bearing is a laminated rubber structure that includes a special filler compound in the rubber itself to provide energy absorption performance. It combines damping and spring characteristics and is widely adopted as a seismic isolator.

However, the conventional high damping rubber shows loading hysteresis dependency, where its rate of change of stiffness has become reduced and restoration becomes progressively worse after repeated loading under increasing deformation. With Bridgestone's next-generation of high damping rubber X series, the effect of loading hysteresis dependency is greatly reduced and the properties become much simpler to manage. Furthermore, it is also more accommodating to the reduction in ultimate properties caused by bi-directional loading.

### ● Reduction in Loading Hysteresis Dependency

Compared to conventional high damping rubber, the change of equivalent shear stiffness (1 cycle/3cycle) in repeated loading is greatly reduced. The properties of seismic isolation bearings are defined by the 3rd cycle and it is able to reduce the load variation during initial deformation.

Conventional high damping rubber shows shear stress reduction after large deformation due to the effect of loading hysteresis dependency, but the next-generation high damping rubber is able to minimize the change in properties before and after large deformation. By reducing the effect of loading hysteresis dependency, the accuracy of the overall seismic isolation design can be improved.

### ● Increasing of Equivalent Damping Ratio

Compared to conventional high damping rubber, the equivalent damping ratio (at shear strain  $\gamma = \pm 100\%$ ) of high damping rubber X0.4S, X0.6R are increased (X0.4S:0.220  $\rightarrow$  0.240, X0.6R:0.225  $\rightarrow$  0.240). Furthermore, compared to the same diameter of lead rubber bearing (lead diameter/outer diameter = 0.2), a higher damping ratio can be obtained in the range of  $\gamma \geq 130\%$ .

# Ultimate Properties of High Damping Rubber Bearings by Horizontal Bi-directional Loading

## ● Outline

The ultimate deformation of high-damping rubber is degraded by applying bi-directional loading compared to unidirectional loading. Through a horizontal bi-directional loading test with a full scale model high-damping rubber bearing, torsional deformation can be seen in the side view of the rubber. Compared with unidirectional loading, the phenomenon of breaking at early stage by bi-directional loading has been identified. The standard value of the ultimate properties, influenced by bi-directional loading is shown below and the ultimate compressive stress is confirmed.

Figure 1: The mechanism of torsional deformation

Figure 2: Torsional deformation during horizontal bi-directional loading

As shown in Figure 1, when the bi-directional loading is applied on a high damping rubber bearing, the elastic force occurs in the shear deformation direction, while the damping force occurs in the tangential direction of the deformation trajectory. The torsional moment created by the damping elements and the shear deformation is present at each rubber layer of the laminated structure. The additional shear strain  $\gamma_{\varnothing}$  caused by torsional deformation is added to the shear strain caused by the rubber shear deformation itself. Thus, it will rupture relatively early compared to the unidirectional loading test. However, the torsional deformation caused by bi-directional loading does not affect the buckling ultimate strain, as verified experimentally.

## ● Ultimate Property of Horizontal Bi-directional Loading

According to the Japan Society of Seismic Isolation (JSSI) guidelines, the final ultimate strain is determined by the minimum of the ultimate strain  $\gamma_L$  by unidirectional loading and the ultimate strain  $\gamma_{Bo}$  by bi-directional loading.

### ● Ultimate strain by unidirectional loading

Ultimate strain by unidirectional loading is defined as shown in Table 1.

Table 1: Standard value of ultimate strain by unidirectional loading

Compound	Ultimate strain by unidirectional loading $\gamma_L$
XO.4S	$S_2 \times 0.9 \times 100\%$ ( $0.9 \times S_2 < 4$ ) $400\%$ ( $0.9 \times S_2 \geq 4$ )
XO.6R	$S_2 \times 0.9 \times 100\%$ ( $S_2 < 4.5$ ) $400\%$ ( $S_2 \geq 4.5$ )

$S_2$ : Second shape factor

### ● Ultimate strain by bi-directional loading

Ultimate strain by bi-directional loading is defined as shown in Table 2.

Table 2: Standard value of ultimate strain by bi-directional loading

Compound	Formula of ultimate strain by bi-directional loading $\gamma_{Bo}$
XO.4S	$\gamma_{Bo} = (5.80 \times S_2 + 9.05) / (S_2 + 4.49)$
XO.6R	$\gamma_{Bo} = (5.00 \times S_2 + 9.05) / (S_2 + 4.49)$

$S_2$ : Second shape factor

Figure 3: Comparison example of ultimate property diagram

## LAP<sup>2</sup> + t.Ver2 (Layout Planning Assistance Program for Seismic Isolation Device)

LAP<sup>2</sup> + t.Ver2 is a program that supports layout planning of Bridgestone seismic isolation bearing for seismically isolated building. The ideal seismic isolation bearing (in terms of size) can be determined from the column axial force (nominal long term column load) and the selections of seismic isolation bearing's series based on the layout of the seismic isolation interface. In addition to Bridgestone made seismic isolation bearings, hysteresis type dampers or oil dampers which are typically used in Japan can be specified in the program. The selections can be changed (or specified) interactively on the GUI (Graphic User Interface) screen by the click of a mouse and the notification calculation for that bearing arrangement can be carried out as well. Besides, regarding to the bearing layout planning, the mathematical process which is using genetic algorithm could produce an optimization function whereby by satisfying the notification calculation and at the same time reduce as much as possible the shear force for the layout plan, or by satisfying the notification calculation and at the same time reduce as much as possible the response displacement for the layout plan that could meet the criterias. In addition to being able to verify by the notification calculation, the Lap<sup>2</sup> + t.Ver2 software allows response calculation for seismic response analysis.

### ● Simple Input

From the data-input and modification of the seismic isolation interface, seismic response analysis can be conducted easily. Also, Lap<sup>2</sup> + t.Ver2 is compatible software that can capture or transfer structural calculation data from the "Super Build / SS3" software which is developed by Union System.

● "Super Build / SS3" is a registered trademark of Union System Inc.

### ● 2 Calculation Functions of Seismically Isolated Structure

● "Seismic Response calculation by seismic isolation notification\*1" .....the results of the calculation can be printed in a reporting style.

● "Seismic response calculation by time history analysis".....the calculation can be conducted for various earthquake waves. Also, Lap<sup>2</sup> + t.Ver2 can work together with the structural calculation software "Super Dynamic Pro" from Union System.

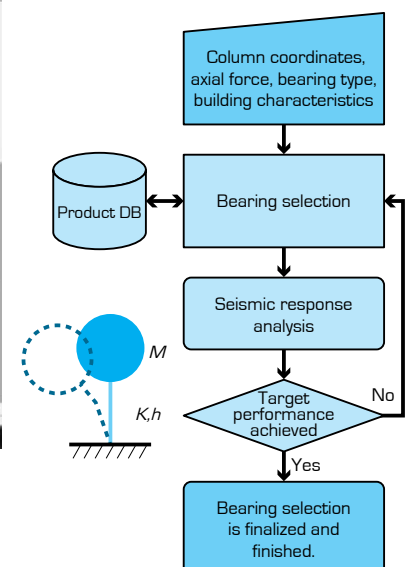

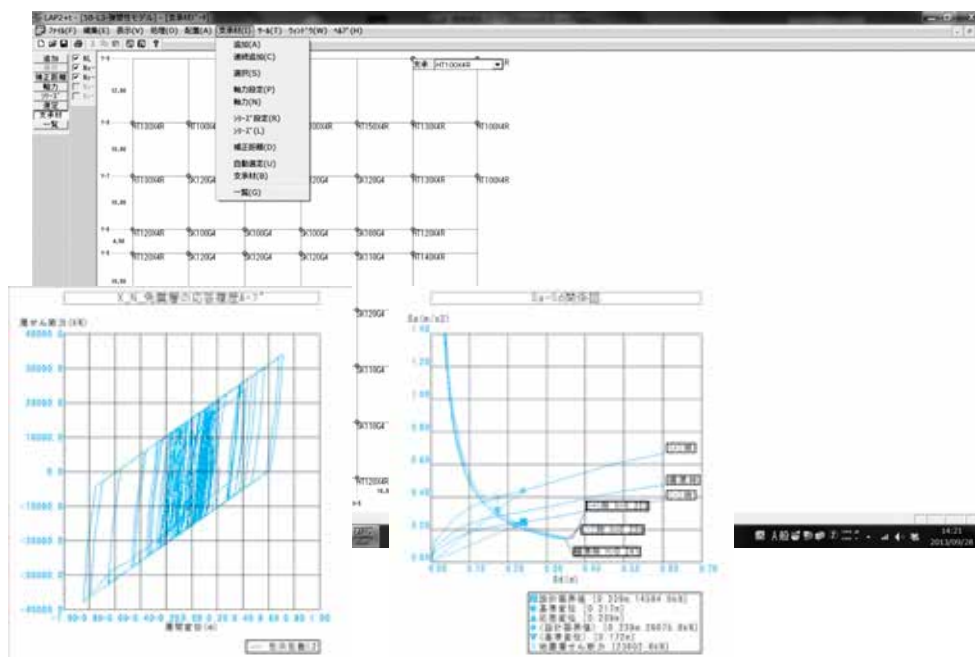

※ 1 The structural calculation method is based on the "Technical standards required for safety which relates to the structural method for seismically-isolated buildings" as stated in the notification No.2009 of the Ministry of Construction, in the year 2000.

### ● Seismic Isolation Devices

Bridgestone natural rubber bearing, lead rubber bearing, high damping rubber bearing, elastic sliding bearing, other standard hysteretic dampers and oil dampers can be adopted.

### ● Layout Planning of Seismic Isolation Devices

The software helps you to choose the appropriate seismic isolation devices and its placement in the building to satisfy the target performance.

# Product Specification & Description of Performance Characteristics

## High Damping Rubber Bearing (HDR)

Seismic isolation material certification number by Ministry of Land, Infrastructure and Transport, Japan  
**MVBR-0516 (XO.3R Series)** Acquired in December 2014  
**MVBR-0510/MVBR-0519 (XO.4S Series)** Acquired in December 2014  
**MVBR-0514/MVBR-0520 (XO.6R Series)** Acquired in December 2014

### Product Dimension

Characteristics			Sectional View	
Physical Dimensions	Outer diameter	: $D_o$ (mm)

### Steel Material

Steel material for each part

Part	Material
Reinforced steel plate	SS400 (JIS G 3101)
Flange <sup>*1*</sup>	SS400 (JIS G 3101)
Connecting plate <sup>*1</sup>	SS400 (JIS G 3101)

\*1: Optionally SM490A (JIS G 3106).

\*2: Optionally special thickness other than standard thickness.

Anti-rust treatment of flange

Preparation	Remove rust up to blasting quality of SSPC-SP-10 (SIS Sa 2 1/2)
Primer	Zinc-rich paint 75 $\mu$ m $\times$ 1 coat
Middle coat	Epoxy resin paint 60 $\mu$ m $\times$ 1 coat
Finishing	Epoxy resin paint 35 $\mu$ m $\times$ 1 coat
Total film thickness	170 $\mu$ m and above

\*1: Standard color is gray.

\*2: Other kinds of anti-rust treatment are also available. Please contact us for more details.

### Precautions

- For mid-storey isolation, fire resistant cover is necessary (according to JSSI provision, HS110X4S cannot apply any fire resistant cover). Please contact fire resistant cover manufacturer who are listed in the JSSI manufacturer list for more details. ([http://www.jssi.or.jp/bussiness/kigyou\\_detail/to-si-base.htm](http://www.jssi.or.jp/bussiness/kigyou_detail/to-si-base.htm))
- There are two certification numbers for XO.4S, XO.6R due to difference of some manufacturing process. Although their properties values are the same, please fill the certification number as shown in the table on the right in the design documents.

	Rubber size $\varnothing$ 1000 and below	Rubber size $\varnothing$ 1100 and above
XO.4S	Both MVBR-0510/MVBR-0519	MVBR-0510 only
XO.6R	Both MVBR-0514/MVBR-0520	MVBR-0514 only

## Shear Properties

**Equivalent shear stiffness  $K_{eq}$ , equivalent damping ratio  $H_{eq}$ , initial stiffness  $K_1$ , post-yield stiffness  $K_2$ , characteristic strength  $Q_d$ , Function giving ratio of characteristic strength to maximum shear force of a loop  $u$**

Shear properties of HDR is dependent on shear strain amplitude. The shear strain dependency of each property is expressed by the following equations.

<ul style="list-style-type: none"> <li>Rubber material X0.3R (<math>0.1 \leq \gamma \leq 3.0</math>)</li> </ul>	$G_{eq}(\gamma) = 0.0255 \gamma^4 - 0.2213 \gamma^3 + 0.7283 \gamma^2 - 1.1028 \gamma + 0.8703$ $H_{eq}(\gamma) = -0.005 \gamma^3 + 0.015 \gamma^2 - 0.006 \gamma + 0.166$ $u(\gamma) = -0.0087 \gamma^3 + 0.0262 \gamma^2 - 0.0105 \gamma + 0.2720$
<ul style="list-style-type: none"> <li>Rubber material X0.4S (<math>0.1 \leq \gamma \leq 2.7</math>)</li> </ul>	$G_{eq}(\gamma) = 0.054 \gamma^4 - 0.416 \gamma^3 + 1.192 \gamma^2 - 1.583 \gamma + 1.145$ $H_{eq}(\gamma) = -0.007 \gamma^3 + 0.020 \gamma^2 - 0.009 \gamma + 0.236$ $u(\gamma) = -0.0132 \gamma^3 + 0.0401 \gamma^2 - 0.0190 \gamma + 0.4001$
<ul style="list-style-type: none"> <li>Rubber material X0.6R (<math>0.1 \leq \gamma \leq 2.7</math>)</li> </ul>	$G_{eq}(\gamma) = 0.620 \times [0.1364 \gamma^4 - 1.016 \gamma^3 + 2.903 \gamma^2 - 3.878 \gamma + 2.855]$ $H_{eq}(\gamma) = 0.240 \times [0.02902 \gamma^3 - 0.1804 \gamma^2 + 0.2364 \gamma + 0.9150]$ $u(\gamma) = 0.408 \times [0.03421 \gamma^3 - 0.2083 \gamma^2 + 0.2711 \gamma + 0.9028]$

Based on above equations, each shear properties shall be determined by the following equations.<sup>1</sup>

Equivalent shear stiffness	: $K_{eq} = G_{eq} \cdot A / H$	Equivalent damping ratio	: $H_{eq} = \Delta W / (2 \pi \cdot K_{eq} \delta^2)$
Initial stiffness	: $K_1 = 10 \times K_2$		
Post-yield stiffness	: $K_2 = K_{eq} (1 - u)$		
Characteristic strength	: $Q_d = u \cdot K_{eq} \cdot H \cdot \gamma$		

\* 1: At standard condition only and shall be excluded when considering the properties variation.

## Temperature dependency

Each shear properties shall be corrected to the value at standard temperature of 20°C by the following equations. (Applicable range:  $-10 \leq T \leq 40^\circ\text{C}$ ) [T : Temperature during inspection]

<ul style="list-style-type: none"> <li>Rubber material X0.3R</li> </ul>	$K_{eq}(T^\circ\text{C}) = K_{eq}[\text{standard value at } 20^\circ\text{C}] \times [1.139 - 9.653 \times 10^{-3} \cdot T + 1.721 \times 10^{-4} \cdot T^2 - 1.847 \times 10^{-6} \cdot T^3]$ $H_{eq}(T^\circ\text{C}) = H_{eq}[\text{standard value at } 20^\circ\text{C}] \times [1.050 - 2.790 \times 10^{-3} \cdot T + 4.678 \times 10^{-5} \cdot T^2 - 1.613 \times 10^{-6} \cdot T^3]$
<ul style="list-style-type: none"> <li>Rubber material X0.4S/X0.6R</li> </ul>	$K_{eq}(T^\circ\text{C}) = K_{eq}[\text{standard value at } 20^\circ\text{C}] \times [1.205 - 1.862 \times 10^{-2} \cdot T + 5.991 \times 10^{-4} \cdot T^2 - 8.991 \times 10^{-6} \cdot T^3]$ $H_{eq}(T^\circ\text{C}) = H_{eq}[\text{standard value at } 20^\circ\text{C}] \times [1.065 - 4.134 \times 10^{-3} \cdot T + 1.096 \times 10^{-4} \cdot T^2 - 3.102 \times 10^{-6} \cdot T^3]$

• Standard value of temperature dependency (Standard temperature [20°C])

Properties values	Equivalent shear stiffness $K_{eq}$				Equivalent damping ratio $H_{eq}$			
	-10°C	0°C	30°C	40°C	-10°C	0°C	30°C	40°C
X0.3R	within +25%	within +14%	within -5%	within -9%	within +8%	within +5%	within -4%	within -9%
X0.4S	within +46%	within +21%	within -6%	within -16%	within +12%	within +7%	within -4%	within -12%
X0.6R	within +46%	within +21%	within -6%	within -16%	within +12%	within +7%	within -5%	within -13%

## Performance variation

The rate of change of main causes (manufacturing variation, aging, temperature change) which affect shear properties as shown below.

Rubber materials	X0.3R		X0.4S		X0.6R	
	Equivalent shear stiffness, $K_{eq}$	Equivalent damping ratio, $H_{eq}$ Function giving ratio of characteristic strength to maximum shear force, $u$	Equivalent shear stiffness, $K_{eq}$	Equivalent damping ratio, $H_{eq}$ Function giving ratio of characteristic strength to maximum shear force, $u$	Equivalent shear stiffness, $K_{eq}$	Equivalent damping ratio, $H_{eq}$ Function giving ratio of characteristic strength to maximum shear force, $u$
Manufacturing variation <sup>*1</sup>	±10%	∓10%	±10%	∓10%	±10%	∓10%
Aging <sup>*2</sup>	+10%	-10%	+10%	-10%	+10%	-10%
Ambient temperature variation 20°C ± 20°C	(+) side	+14%	+5%	+21%	+7%	+21%
	(-) side	-9%	-9%	-16%	-12%	-16%
Total	(+) side <sup>*3</sup>	+34%	-15%	+41%	-13%	+41%
	(-) side <sup>*3</sup>	-19%	+1%	-26%	-2%	-26%

\* 1: The variation of each product (standard value) shall be within ±20% and variation of total units of products per project (total of standard values) shall be within ±10%. However, if the total units of products is less than 8 units per project, the variation (total of standard values) shall be within ±15%.

(For  $H_{eq}$ ,  $\Sigma (H_{eq} \times K_{eq}) / \Sigma K_{eq}$  shall be within ±15% from the standard value)

Note: For compressive stiffness  $K_v$ , variation of each product (standard value) shall be within ±30%.

\* 2: Predicted rate of change after 60 years at 20°C standard temperature.

\* 3: The equivalent shear stiffness  $K_{eq}$  and equivalent damping ratio  $H_{eq}$  is dependent to each other. The indicated rate of change of  $H_{eq}$  are corresponding to both maximum and minimum rate of change of  $K_{eq}$  respectively.

\* 4: Above list shows the combination example.

## Compressive Properties

### Compressive stiffness $K_V$

Compressive stiffness  $K_V$  is determined by the following equation.

$$K_V = E_C \cdot \frac{A}{H} \quad E_C = \frac{E(1+2\kappa S_1^2)}{1+E(1+2\kappa S_1^2)/E_x}$$

### Ultimate compressive stress

Critical stress  $\sigma_{cr}$  at zero shear strain is determined by the following equation.

$$\sigma_{cr} = \alpha_c \cdot \frac{\pi}{4} (G_{eq} \cdot E_b)^{0.5} \cdot S_2$$

However,  $E_b = E_{cr} [1 + 2/3 \cdot \kappa \cdot S_1^2] / [1 + E_{cr} (1 + 2/3 \cdot \kappa \cdot S_1^2) / E_x]$

[Note]  $S_1$  is defined as 35.0 (for X0.4S, X0.6R) and 28.0 (for X0.3R) as standard value.

$\alpha_c$ : Correction factor determined from our test data

Rubber material X0.3R:  $\alpha_c = 1.0$  (if  $S_2 \geq 5$ )  $\alpha_c = 1 - 0.2 (5 - S_2)$  (if  $5 > S_2$ )

Rubber material X0.4S:  $\alpha_c = 0.88$  (if  $S_2 \geq 5$ )  $\alpha_c = 0.88 (1 - 0.07 (5 - S_2))$  (if  $5 > S_2$ )

Rubber material X0.6R:  $\alpha_c = 1.45$  (if  $S_2 \geq 5$ )  $\alpha_c = 1.45 - 0.3 (5 - S_2)$  (if  $5 > S_2$ )

$E_{CR} = 3 \times G_{eq}$  (for X0.4S, X0.6R)  $E_{CR} = 2.2$  (for X0.3R)

Ultimate compressive stress at any shear strain  $\sigma_{cr}'(\gamma)$  is determined by  $\sigma_{cr}$  by the following equation.

$$\sigma_{cr}'(\gamma) = \sigma_{cr} \cdot \left(1 - \frac{\gamma}{S_2}\right)$$

The ultimate compressive stress shall not exceed the upper limit  $\sigma_L$  determined as below and the strain region corresponding to the ultimate strain  $\gamma_L$  at 0 compressive stress.

Rubber material X0.3R:  $\sigma_L = 40$  (if  $S_2 \geq 5.0$ )  $\sigma_L = 40 + 10 (S_2 - 5)$  ( $5.0 > S_2 \geq 3.0$ )

$\gamma_L$  is defined as minimum value among  $\lceil 400\% \rceil$ ,  $\lceil S_2 \times 0.9 \times 100\% \rceil$ ,  $\lceil (5.80 \times S_2 + 7.10) / (S_2 + 3.45) \times 100\% \rceil$

Rubber material X0.4S:  $\sigma_L = 45$  (if  $S_2 \geq 4.9$ )  $\sigma_L = 45 + 10 (S_2 - 5)$  (if  $4.9 > S_2 \geq 4.0$ )  $\sigma_L = 40 + 10 (S_2 - 5)$  (if  $4.0 > S_2 \geq 3.0$ )

$\gamma_L$  is defined as minimum value among  $\lceil 400\% \rceil$ ,  $\lceil S_2 \times 0.9 \times 100\% \rceil$ ,  $\lceil (5.80 \times S_2 + 9.05) / (S_2 + 4.49) \times 100\% \rceil$

Rubber material X0.6R:  $\sigma_L = 60$  (if  $S_2 \geq 4.9$ )  $\sigma_L = 48 + 14 (S_2 - 4)$  (if  $4.9 > S_2 \geq 4.0$ )

$\sigma_L = 24 + 24 (S_2 - 3)$  (if  $4.0 > S_2 \geq 3.5$ )  $\sigma_L = 22 + 28 (S_2 - 3)$  (if  $3.5 > S_2 \geq 3.0$ )

$\gamma_L$  is defined as minimum value among  $\lceil 400\% \rceil$ ,  $\lceil S_2 \times 0.9 \times 100\% \rceil$ ,  $\lceil (5.00 \times S_2 + 9.05) / (S_2 + 4.49) \times 100\% \rceil$

## Lead Rubber Bearing (LRB)

Seismic isolation material certification number by Ministry of Land, Infrastructure and Transport, Japan  
MVBR-0517  
Acquired in December 2014

### Product Dimension

Characteristics		Sectional View	
Physical Dimensions	Outer diameter	: $D_o$ (mm)	
	Lead plug diameter	: $D_i$ (mm)	
	Number of inner diameter	: $A_r \times 10^2$ (mm <sup>2</sup> )	
	Effective plane area	: $t_r$ (mm)	
	Thickness of one rubber layer	: $n$	
	Number of rubber layers	: $H = n \cdot t_r$ (mm)	
	First shape factor $S_1 = (D_o) / (4 \cdot t_r)$		
	Second shape factor $S_2 = D_o / (n \cdot t_r)$		
	Diameter of flange	: $D_r$ (mm)	
	Thickness of flange: edge/center	: $t_r / t_e$ (mm)	
	Connecting bolt PCD	: PCD (mm)	
	Diameter of connecting bolt hole $\times$ qty	: $d_b$ (mm) $\times$ qty	
	Bolt size (assumption)	: $M (d_b - 3)$	
	Thickness of each reinforced steel plate	: $t_s$ (mm)	
	Total height	: $H_t$ (mm)	
Total weight 1 (kN) = 1/9.80665 (tonf)			

### Rubber Material

Notation of rubber kind (standard temperature 20°C standard strain  $\gamma = 100\%$ )

Compound name	Rubber code	Shear modulus $G_{eq}$ (N/mm <sup>2</sup> )
G4	G0.4	0.385

Composition of rubber materials (weight ratio %)

Rubber code	Natural rubber Synthetic rubber	Filler; Reinforcement agent	Vulcanization agent and others
Inner rubber (G0.4)	60 and above	10 and above	25 and below
Cover rubber	40 and above	15 and above	40 and below

Properties of rubber materials

Item	Tensile strength (N/mm <sup>2</sup> )	Elongation at Break (%)	Hardness (JIS A)	100% modulus (N/mm <sup>2</sup> )	Young's modulus E (N/mm <sup>2</sup> )	Bulk modulus $E_v$ (N/mm <sup>2</sup> )	Correction factor for apparent Young's modulus according to hardness, k
Test Standard	JIS K6251	JIS K6251	JIS K6253	JIS K6251	-	-	-
Inner rubber	17 and above	600 and above	37 $\pm$ 5	0.8 $\pm$ 0.2	2.20	1176	0.85
Cover rubber	12 and above	600 and above	-	-	-	-	-

### Steel Material

Steel material for each part

	Material
Reinforced steel plate	SS400 (JIS G 3101)
Flange <sup>*1,2</sup>	SS400 (JIS G 3101)
Connecting plate <sup>*1</sup>	SS400 (JIS G 3101)
Lead plug	Pb (JIS H 2105 special)

\*1: Optionally SM490A (JIS G 3106).

\*2: Optionally special thickness other than standard thickness.

Anti-rust treatment of flange

Preparation	Remove rust up to blasting quality of SSPC-SP-10 (SIS Sa 2 1/2)
Primer	Zinc-rich paint. 75 $\mu$ m $\times$ 1 coat
Middle coat	Epoxy resin paint. 60 $\mu$ m $\times$ 1 coat
Finishing	Epoxy resin paint. 35 $\mu$ m $\times$ 1 coat
Total film thickness	170 $\mu$ m and above

\*1: Standard color is gray.

\*2: Other kinds of anti-rust treatment are also available. Please contact us for more details.

### Precautions

- Due to the lead plug embedded in the center of the laminated rubber body, special treatment is required in case the laminated rubber bearing is to be treated as industrial waste, depending on country. Please confirm with the country's regulation.
- For mid-storey isolation, fire resistant cover is necessary. Please check with fire resistant cover manufacturer who are listed in the JSSI manufacturer list for more details. ([http://www.jssi.or.jp/business/kigyoun\\_detail/to-si-base.htm](http://www.jssi.or.jp/business/kigyoun_detail/to-si-base.htm))

## Shear Properties

### Equivalent shear stiffness $K_{eq}$ , equivalent damping ratio $H_{eq}$ , initial stiffness $K_1$ , post-yield stiffness $K_2$ , characteristic strength $Q_d$

Shear properties of LRB is dependent on shear strain amplitude.

The shear strain dependency of each property is expressed by the following equations.

Post-yield stiffness :  $K_2 = K_d = C_{kd} \cdot (K_r + K_p)$   
 Shear stiffness of laminated rubber :  $K_r = G_r \cdot A_r / H$   
 Additional shear stiffness by lead plug :  $K_p = \alpha_p \cdot A_p / H$   
 Where,  $C_{kd}$  : post-yield stiffness correction factor due to strain dependency  
 $G_r$  : shear modulus of rubber 0.385N/mm<sup>2</sup>  
 $\gamma$  : shear strain  
 $\alpha_p$  : apparent shear modulus of lead 0.583N/mm<sup>2</sup>

Characteristics strength :  $Q_d = C_{qd} \cdot \sigma_{pb} \cdot A_p$   
 Where,  $C_{qd}$  : characteristic strength correction factor due to strain dependency  
 $\sigma_{pb}$  : Shear stress at yield of lead 7.967N/mm<sup>2</sup>

Initial stiffness :  $K_1 = \beta \cdot K_d$   
 Where,  $\beta$  : Ratio of initial stiffness to post-yield stiffness which is between 10~15. (recommended value: 13)  
 Equivalent shear stiffness  $K_{eq}$     Equivalent damping ratio  $H_{eq}$

$$K_{eq} = \frac{Q_d}{\gamma \cdot H} + K_d$$

$$H_{eq} = \frac{2}{\pi} \cdot \frac{Q_d \left( \gamma \cdot H - \frac{Q_d}{(\beta - 1)K_d} \right)}{K_{eq} \cdot (\gamma \cdot H)^2}$$

### Temperature dependency

Each shear properties shall be corrected to the value at standard temperature of 20°C by the following equations (Applicable range:  $-20 \leq T \leq 40^\circ\text{C}$ ) (T: Temperature during inspection)

• Temperature correction equation :  $K_d (T^\circ\text{C}) = K_d [\text{standard value at } 20^\circ\text{C}] \times [1.052 - 2.955 \times 10^{-3} \cdot T + 1.895 \times 10^{-5} \cdot T^2]$   
 $Q_d (T^\circ\text{C}) = Q_d [\text{standard value at } 20^\circ\text{C}] \times [1.192 - 1.017 \times 10^{-2} \cdot T + 2.722 \times 10^{-5} \cdot T^2]$

• Standard value of temperature dependency    Standard temperature (20°C)<sup>\*1</sup>

Properties values	-10°C	0°C	30°C	40°C
Post-yield stiffness $K_d$	+10%	+6%	-3%	-5%
Characteristic strength $Q_d$	+36%	+23%	-11%	-21%

\*1 : The standard value takes into account the variation of 20% to the value obtained by the temperature correction equation.

### Performance variation

The rate of change of main causes (manufacturing variation, aging, temperature change) which affect shear properties as shown below.

Rubber materials	GO.4		
Properties	Post-yield stiffness $K_d$	Characteristic strength $Q_d$	
Manufacturing variation <sup>*2</sup>	Within $\pm 10\%$	Within $\pm 10\%$	
Aging <sup>*3</sup>	Within +10%	-	
Ambient temperature variation 20°C $\pm$ 20°C	(+) side	Within +6%	Within +23%
	(-) side	Within -5%	Within -21%
Total	(+) side	Within +26%	Within +33%
	(-) side	Within -15%	Within -31%

\*2 : The variation of each product. (standard value) shall be within  $\pm 20\%$  and variation of total units of products per project (total of standard values) shall be within  $\pm 10\%$ .

If total units per project are less than 8 units, variation of total units of products per project (total of standard values) shall be within  $\pm 15\%$ .

\*3 : Predicted rate of change after 60 years at 20°C standard temperature. (20% variation is considered in the rate of change)

\*4 : Above list shows the combination example.

## Compressive Properties

### Compressive stiffness $K_v$

• Compressive stiffness  $K_v$  is determined by the following equation.

$K_v = \alpha_v \cdot E_c \cdot \frac{A}{H}$      $E_c = \frac{E(1+2\kappa S_1^2)}{1+E(1+2\kappa S_1^2)/E_c}$     A : Laminated rubber plane area    A<sub>r</sub> : Effective plane area    A<sub>p</sub> : Lead plug plane area  
 A = A<sub>r</sub> + A<sub>p</sub>  
 $\alpha_v$  : Young's modulus correction factor = 1.23

### Ultimate compressive stress (refer the figure on the right)

• Critical stress  $\sigma_{cr}$  at zero shear strain is determined by the following equation.

$$\sigma_{cr} = \frac{\pi}{4} \cdot 1.26 \cdot \alpha_c \cdot (G_{eq} \cdot E_b)^{0.5} \cdot S_2$$

However,  $E_b = E [1 + 2/3 \cdot \kappa \cdot S_1^2] / [1 + E(1 + 2/3 \cdot \kappa \cdot S_1^2) / E_c]$

$\alpha_c$  : Correction factor based on  $S_2$  determined from our test data

If  $S_2 \geq 5$  :  $\alpha_c = 1$ , if  $S_2 < 5$  :  $\alpha_c = 0.25 \cdot (S_2 - 5) + 1$

• Ultimate compressive stress at any shear strain  $\sigma_{cr}(\gamma)$  is determined by  $\sigma_{cr}$  by the following equation.

$$\sigma_{cr}(\gamma) = \sigma_{cr} \cdot (1 - 0.9 \frac{\gamma}{S_2})$$

• The ultimate compressive stress shall not exceed the upper limit  $\sigma_L$  determined as below and the strain region corresponding to the ultimate strain  $\gamma_L$  at 0 compressive stress.

$$\sigma_L = 60 \text{ [N/mm}^2\text{]}$$

$$\gamma_L = \min [400\%, S_2 \times 100\%]$$

## Natural Rubber Bearing (NRB)

Seismic isolation material certification number by Ministry of Land, Infrastructure and Transport, Japan  
**MVBR-0295 (N3, G3, G5)** Acquired in January 2006  
**MVBR-0509/MVBR-0518 (G4)** Acquired in December 2014

### Product Dimension

### Steel Material

Steel material for each part

Part	Material
Reinforced steel plate	SS400 (JIS G 3101)
Flange <sup>*1,*2</sup>	SS400 (JIS G 3101)
Connecting plate <sup>*1</sup>	SS400 (JIS G 3101)

\*1: Optionally SM490A (JIS G 3106).

\*2: Optionally special thickness other than standard thickness.

Anti-rust treatment of flange

Preparation	Remove rust up to blasting quality of SSPC-SP-10 (SIS Sa 2 1/2)
Primer	Zinc-rich paint 75 $\mu$ m $\times$ 1 coat
Middle coat	Epoxy resin paint 60 $\mu$ m $\times$ 1 coat
Finishing	Epoxy resin paint 35 $\mu$ m $\times$ 1 coat
Total film thickness	170 $\mu$ m and above

\*1: Standard color is gray.

\*2: Other kinds of anti-rust treatment are also available. Please contact us for more details.

### Precautions

- For mid-storey isolation, fire resistant cover is necessary. Please contact fire resistant cover manufacturer who are listed in the JSSI manufacturer list for more details. ([http://www.jssi.or.jp/bussiness/kigyou\\_detail/to-si-base.htm](http://www.jssi.or.jp/bussiness/kigyou_detail/to-si-base.htm))
- There are two certification numbers for G0.40 due to difference of some manufacturing process. Although their properties values are the same, please fill the certification number as shown in the table on the right in the design documents.

Rubber size $\phi$ 1000 and below	Rubber size $\phi$ 1100 and above
Both MVBR-0509/MVBR-0518	MVBR-0509 only

## Shear Properties

### Shear stiffness $K_h$

NRB shows linear restoring force characteristics in horizontal direction.

Shear stiffness  $K_h$  is expressed by the following equation.

$$K_h = \frac{G_{eq} \cdot A}{H}$$

$\delta_0$  : Displacement equivalent to 100% strain  
 $P_0$  : Maximum load  
 $K_h$  : Shear stiffness (secant stiffness)  
 $G_{eq}$  : Shear modulus

### Temperature dependency

Shear stiffness shall be corrected to the value at standard temperature of 20°C by the following equation.

(Applicable:  $-10 \leq T \leq 40^\circ\text{C}$ ) (T: Temperature during inspection)

● Temperature correction equation :

$$K_h (T^\circ\text{C}) = K_h (\text{standard value at } 20^\circ\text{C}) \times (1.052 - 2.955 \times 10^{-3} \cdot T + 1.895 \times 10^{-5} \cdot T^2)$$

(Applied to all rubber codes)

● Standard value of temperature dependency Standard temperature (20°C)<sup>\*1</sup>

Properties values	-10°C	0°C	30°C	40°C
Shear stiffness $K_h$	+8%	+6%	-3%	-5%

\*1 : The standard value takes into account the variation of 20% to the value obtained by the temperature correction equation.

### Performance variation

The rate of change of main causes (manufacturing variation, aging, temperature change) which affect shear properties as shown below.

Rubber materials	Common
Properties	Shear stiffness $K_h$
Manufacturing variation <sup>*2</sup>	Within $\pm 10\%$
Aging <sup>*3</sup>	Within +10%
Ambient temperature variation $20^\circ\text{C} \pm 20^\circ\text{C}$	(+) side Within +6% (-) side Within -5%
Total	(+) side Within +26% (-) side Within -15%

\*2 : The variation of each product (standard value) shall be within  $\pm 20\%$  and variation of total units of products per project (total of standard values) shall be within  $\pm 10\%$ . However, if the total units of products is less than 8 units per project, the variation (total of standard values) shall be within  $\pm 15\%$ .

(Note: For compressive stiffness  $K_v$ , variation of each product (standard value) shall be within  $\pm 20\%$ .)

\*3 : Predicted rate of change after 60 years at 20°C standard temperature.  
 [20% variation is considered in the rate of change]

## Compressive Properties

### Compressive stiffness $K_v$

● Compressive stiffness  $K_v$  is determined by the following equation.

$$K_v = E_c \cdot \frac{A}{H} \quad E_c = \frac{E(1+2\kappa S_1^2)}{1+E(1+2\kappa S_1^2)/E_\infty}$$

### Ultimate compressive stress (refer the figure on the right)

● Critical stress  $\sigma_{cr}$  at zero shear strain is determined by the following equation.

$$\sigma_{cr} = \pi/4 \cdot \alpha_c \cdot (G_{eq} \cdot E_b)^{0.5} \cdot S_2$$

However,  $E_b = E(1+2/3 \cdot \kappa \cdot S_1^2) / \{1 + E(1+2/3 \cdot \kappa \cdot S_1^2) / E_\infty\}$

$\alpha_c$  : Correction factor based on  $S_2$  determined from our test data

If  $S_2 \geq 5$  :  $\alpha_c = 1.0$ , if  $S_2 < 5$  :  $\alpha_c = 0.10 \cdot (S_2 - 5) + 1$

● Ultimate compressive stress at any shear strain  $\sigma_{cr}'(\gamma)$  is determined by  $\sigma_{cr}$  by the following equation.

$$\sigma_{cr}'(\gamma) = \sigma_{cr} \cdot (1 - \beta_c \cdot \gamma / S_2)$$

$\beta_c$  : Correction factor based on  $S_2$  determined from our test data

If  $S_2 \geq 5$  :  $\beta_c = 0.76$ , if  $S_2 < 5$  :  $\beta_c = 0.76 / \{0.15 \cdot (S_2 - 5) + 1\}$

● The ultimate compressive stress shall not exceed the upper limit  $\sigma_L$  determined as below and the strain region corresponding to the ultimate strain  $\gamma_L$  at 0 compressive stress.

Rubber materials GO.30, GO.35 :  $\sigma_L = 40$  [N/mm<sup>2</sup>]

Rubber materials GO.40, GO.45 :  $\sigma_L = 60$  [N/mm<sup>2</sup>]

$\gamma_L = \min(400\%, S_2 \times 100\%)$

\*1 Special thickness for flange is available. Please refer to the table on the next page (upper top table) for more details.

\*2 Nominal long term compressive stress is referred as long term upper limit of compressive stress.

Specification of flange (edge thickness / center thickness)

Outer diameter of rubber bearing (Ø) <sup>*1</sup>	(600)	(650)	700	750	800	850	900	950	1000	1100	1200	1300				
Standard thickness	22/28	22/28	22/28	22/28	24/32	24/32	28/36	28/36	28/36	30/38	32/40	32/40				
Special thickness (option)	[26/32]	[26/32]	26/32	30/36	32/40	32/40	37/45	37/45	42/50	42/50	42/50	42/50				

×1 For adoption of special thickness in regard to those sizes that stated in the ( ), delivery time will be longer due to mold preparation.  
 ×2 For Ø1400 and above, assembled type flange will be used.  
 ×3 Compared to the standard specification, total height & weight of product for special thickness will be changed.

MVBR-0514/MVBR-0520 (X0.6R)

Note: There are 2 certification numbers due to difference of some manufacturing process.  
 Please refer to "Precautions" in page 6 for the certificate number that used for design document.

×1 Special thickness for flange is available. Please refer to the table on the next page (upper top table) for more details.

×2 Nominal long term compressive stress is referred as long term upper limit of compressive stress.

Specification of flange (edge thickness / center thickness)

Outer diameter of rubber bearing (Ø) <sup>*1</sup>	(900)	(950)	1000	1100	1200	1300
Standard thickness	28/36	28/36	28/36	30/38	32/40	32/40
Special thickness (option)	[37/45]	[37/45]	42/50	42/50	42/50	42/50

×1 For adoption of special thickness in regard to those sizes that stated in the ( ), delivery time will be longer due to mold preparation.  
 ×2 For Ø1400 and above, assembled type flange will be used.  
 ×3 Compared to the standard specification, total height & weight of product for special thickness will be changed.

MVBR-0514/MVBR-0520 (X0.6R)

Note: There are 2 certification numbers due to difference of some manufacturing process.

×1 Special thickness for flange is available. Please refer to the table above for more details.

Specification of flange (edge thickness / center thickness)

Outer diameter of rubber bearing (Ø) <sup>*1</sup>	(600)	(650)	700	750	800	850	900	950	1000	1100	1200	1300
Standard thickness	22/28	22/28	22/28	22/28	24/32	24/32	28/36	28/36	28/36	30/38	32/40	32/40
Special thickness (option)	[26/32]	[26/32]	26/32	[30/36]	32/40	32/40	37/45	37/45	42/50	42/50	42/50	42/50

\*1 For adoption of special thickness in regard to those sizes that stated in the ( ), delivery time will be longer due to mold preparation.  
 \*2 For Ø1400 and above, assembled type flange will be used.  
 \*3 Compared to the standard specification, total height & weight of product for special thickness will be changed.

MVBR-0510/MVBR-0519 (X0.4S)

Note: There are 2 certification numbers due to difference of some manufacturing process.  
 Please refer to "Precautions" in page 6 for the certificate number that used for design document.

\* : Special thickness for flange is available. Please refer to the table on the next page [upper top table] for more details.

Specification of flange (edge thickness / center thickness)

Outer diameter of rubber bearing (Ø) <sup>*1</sup>	(600)	(650)	700	750	800	850	900	950	1000	1100	1200	1300
Standard thickness	22/28	22/28	22/28	22/28	24/32	24/32	28/36	28/36	28/36	30/38	32/40	32/40
Special thickness (option)	(26/32)	(26/32)	26/32	30/36	32/40	32/40	37/45	37/45	42/50	42/50	42/50	42/50

\*1 For adoption of special thickness in regard to those sizes that stated in the ( ), delivery time will be longer due to mold preparation.

\*2 For Ø1400 and above, assembled type flange will be used.

\*3 Compared to the standard specification, total height & weight of product for special thickness will be changed.

Certification number MVBR-0517

Shear Properties	Shear stiffness (shear strain: $\gamma = \pm 100\%$ ) (×10 <sup>3</sup> kN/m)		0.693	0.739	0.803	0.866	0.912	0.976	1.04	1.09	1.15	1.26	1.39

\* : Special thickness for flange is available. Please refer to the table on the next page (upper top table) for more details.

Specification of flange (edge thickness / center thickness)

Outer diameter of rubber bearing (∅) <sup>*1</sup>	(600)	(650)	700	750	800	850	900	950	1000	1100	1200	1300
Standard thickness	22/28	22/28	22/28	22/28	24/32	24/32	28/36	28/36	28/36	30/38	32/40	32/40
Special thickness (option)	(26/32)	(26/32)	26/32	30/36	32/40	32/40	37/45	37/45	42/50	42/50	42/50	42/50

\*1 For adoption of special thickness in regard to those sizes that stated in the ( ), delivery time will be longer due to mold preparation.

\*2 For ∅1400 and above, assembled type flange will be used.

\*3 Compared to the standard specification, total height & weight of product for special thickness will be changed.

## Compact Flange Type

### ●Characteristic

#### ■Installation space improvement

It could save space during installation because the flange size has been minimized in compact shape. Reduction of footing size is possible especially in the retrofit project, edge part's placement & etc.

#### ■Round shape of rubber bearing

Because of round-shape of rubber bearing, there is no change of shear characteristics due to direction.

### ●Line-up

Line-up is for the flange-integrated seismic isolation bearing. Please contact us for any size that isn't listed in the table below.

#### ■Supports many types of seismic isolation rubber bearing

Any size can be selected from Bridgestone's product range.

※Compared to round-shape flange, compact flange has some limitations in the strength of the flange, displacement of rubber bearing & etc. Please contact us for more details.

Certification Number	Series	Size (diameter of rubber bearing)	Type of Rubber	Performance
MVBR-0510/MVBR-0519 MVBR-0514/MVBR-0520	HDR	Ø600 - Ø1300	X4S X6R	Equivalent to Bridgestone seismic isolation rubber (round-shape flange)
MVBR-0509/MVBR-0518 MVBR-0295	NRB	Ø600 - Ø1300	G4 N3, G3, G5	
MVBR-0517	LRB	Ø600 - Ø1300	G4	

※ For Ø1400 and above, assembled type flange will be used.

### ●Flange Size Table

Diameter of rubber bearing	600	650	700	750	800	850	900	950	1000	1100	1200	1300
Diameter of round-shape flange (D)	900	950	1000	1100	1150	1200	1250	1300	1400	1500	1600	1700
Length of one side of a compact flange (L)	745	795	845	910	965	1010	1055	1100	1200	1290	1380	1470
D - L	155	155	155	190	185	190	195	200	200	210	220	230

### Comparison Between Compact Flange and Round-shape Flange

Compact flange

●Comparison of flange's dimension

Round-shape flange

●View of reinforcement bar arrangement

(Assume 8-M36)  
Compared to the diameter of round-shape flange (D), the length of one side of a compact flange (L) is about 13-16% smaller, depend on sizes.  
(This figure is an example of rubber diameter Ø1000)

View of reinforcement bar arrangement with span of 180-200mm.

## Precautions for Safe Use of Seismic Isolation Bearing (SIB)

- The term “SIB” as used in this precautions means seismic isolation bearing for seismically isolated building, including sliding bearing.

<b>⚠ WARNING</b>	<b>Failure to follow these precautions may result in death or serious injury.</b>
<b>SIB is heavy. Falling or rolling SIB may cause death or serious injury.</b>	
<ul style="list-style-type: none"> <li>■ <b>Always be careful when you move SIB.</b> <ul style="list-style-type: none"> <li>• Transport SIB one by one. If not, it becomes unstable.</li> </ul> </li> <li>■ <b>When lifting the SIB with a crane or others, observe the followings.</b> <ul style="list-style-type: none"> <li>• Use a crane or a suspending jig (eyebolt or others) corresponding to the product weight of the SIB, and use the bolt hole of SIB flange and hoist at 4 points or more. If not, it becomes unstable.</li> <li>• Sufficiently check the safety of the surroundings beforehand so that no one enters around the suspended load.</li> </ul> </li> </ul>	
<b>Rubber part of SIB is flammable. Ignition / catch fire on SIB may cause fire or burn.</b>	
<ul style="list-style-type: none"> <li>• Be away from a fire and do not weld the flange part or such like.</li> </ul>	

<b>NOTICE</b>	<b>Failure to follow these precautions may result in damage to other property, or damage, low performance, malfunction or early deterioration in durability of SIB itself.</b>
<ul style="list-style-type: none"> <li>• Do not apply large impact (falling, collision, etc.) to SIB. Damaged SIB may cause function deterioration of the SIB and an early deterioration in durability.</li> <li>• Do not roll the SIB or twist it with iron lever or bar. Damaged SIB may cause function deterioration and an early deterioration in durability.</li> <li>• Be careful not to damage the SIB with other equipment (such as a cutter when packaging removal). Damaged SIB may cause function deterioration of the SIB and an early deterioration in durability.</li> <li>• In case of outdoor storage, be sure to take measures against rain. Due to wetting with rainwater, it may cause an early deterioration in durability to the flange antirust coating part.</li> <li>• Do not expose the SIB to a temporary high temperature condition (about 100 ° C or higher). Due to the influence of heat, the rubber part of the SIB may be damaged, which may cause function deterioration of the SIB and an early deterioration in durability.</li> <li>• When tightening the bolt in SIB installation work, do not damage the flange antirust coating part with bolt / washer fastening jig or others. It may cause an early deterioration in durability to the flange antirust coating part.</li> <li>• Install the SIB so that the horizontal inclination of the foundation becomes less than 1/400 in inclination accuracy. (Except when our company acknowledges in advance.) When mounted in an inclined, SIB may not function properly (function deterioration may occur).</li> <li>• Do not apply or adhere oils, solvents etc. to the rubber part. Due to deterioration, dissolution etc. of the rubber part may cause function deterioration of the SIB and an early deterioration in durability.</li> <li>• Do not scratch the coating part of the sliding plate when removing the packing of the sliding plate of sliding bearing. Damage of the coating part may cause function deterioration and an early deterioration in durability.</li> <li>• If the residual displacement after the earthquake is equal to or greater than the preset displacement (standard 5 cm), promptly take measures to restore it to the origin. It may cause function deterioration of the SIB and an early deterioration in durability.</li> <li>• After installing SIB, consider aeration and ventilation as much as possible inside seismic isolation interface, and remove moisture by condensation as necessary. It may cause an early deterioration in durability to the flange antirust coating part.</li> <li>• Carry out proper maintenance as prescribed in the design document (building completion inspection · normal inspection · periodical inspection · emergency inspection · detailed inspection etc. by experts). It is necessary to periodically check whether events that may cause function deterioration of the SIB and an early deterioration in durability have occurred.</li> </ul>	

- Specification and parameter may vary. Please enquire our company or any group's subsidiary whenever want to use it.
- Content of catalogue is as on October 2022.
